Taoyuan City LTC 2.0 — Workforce Supply–Demand Gap Analysis

Information Management 3A – Chiu, Yun-Hsuan (112403012)

GitHub Repository: https://github.com/donut576/longtermcare-project.git

Colab：https://colab.research.google.com/drive/10ZnHKMksVFpFdiAS5Vn1mXsi-opE5e-9?usp=sharing

---

As Taiwan officially entered a super-aged society in 2025, long-term care demand is increasing rapidly.

However, a critical question remains:

Can the caregiving workforce keep up with this demand?

This project answers that question through data analysis, statistical modelling, and a GenAI-based policy system.

Chapter 0 · Environment Setup

Install all dependencies once before running the notebook.

In [2]:
```
# ========================================
# Chapter 0: Environment Setup
# ========================================
# Run once to install all required packages:
# !pip install pandas numpy matplotlib seaborn scikit-learn statsmodels \
#              prophet rouge-score python-dotenv sentence-transformers \
#              google-generativeai

import sys
print(f"Python version: {sys.version}")
```

```
Python version: 3.11.5 (tags/v3.11.5:cce6ba9, Aug 24 2023, 14:38:34) [MSC v.1936
64 bit (AMD64)]
```

Chapter 1 · Project Topic, Motivation & Data Sources

1.1 Research Background

Taiwan officially entered a **super-aged society** in 2025 (65+ population > 20%). Taoyuan City — Taiwan's second most populous city — is experiencing especially

rapid growth in long-term care (LTC) demand. Since **LTC 2.0** launched in 2017, service coverage has expanded dramatically, yet **whether the caregiving workforce can keep pace with demand has never been rigorously quantified**.

1.2 Research Questions

1. Between **2013 and 2024**, has Taoyuan's care-worker supply growth rate kept pace with service-demand growth?
2. What is the magnitude of the **supply–demand gap**? What are projected trends for 2025–2027?
3. Does **training investment** (trainee headcount) significantly affect care-worker workforce growth?

1.3 Data Sources

Dataset	Time Range	Key Variables	Role in Analysis
Taoyuan Home Care Training Participants	2011–2018	Year, trainee count	Workforce input (leading indicator)
Taoyuan Day Care Dementia Cases	2004–2017	Year, case count	**Demand side**
Taoyuan LTC Institutions Occupancy	2004–2024	Year, resident count	**Demand side** (primary)
LTC 2.0 Care Workers — Taiwan (snapshot)	2024 (single year)	Region, headcount	**Supply side** (national baseline)
Taoyuan LTC Institution Staff by Type	2013–2024	Year, staff type, count	**Supply side** (primary)

All datasets are sourced from the **Taoyuan City Government Open Data Platform**.

1.4 Analytical Framework

This project adopts a **supply–demand gap framework**:

```
Gap (t) = Required_Workers(t) - Actual_Workers(t)

where  Required_Workers(t) = Demand_Total(t) ×
Baseline_Ratio_2013
       Baseline_Ratio_2013  = Care_Workers_2013 /
Demand_Total_2013
```

- **Demand side**: Actual institutional residents + day-care cases (2004–2024)
- **Supply side**: Care workers within institutional staff (2013–2024)
- **Core analysis period**: 2013–2024 (both main indicators fully overlap)
- **Positive shortfall** = actual workers fall short of the 2013 staffing standard

---

1.5 Two-Part Analysis Plan

Part	Method
(A) Data Analysis & Modelling	Descriptive stats · Visualisation · Prophet + Linear Regression
(B) GenAI Application (RAG Q&A)	Semantic retrieval · Gemini generation · ROUGE-L evaluation

> **Note:** The two approaches address the **same research questions** from complementary angles — quantitative modelling (Part A) builds the evidence base that the RAG knowledge base (Part B) draws upon.

Chapter 2 · Data Loading & Cleaning

Chapter 3 · Summary Statistics

We compute:

1. **Descriptive statistics** for the three core indicators (care workers, total demand, training headcount)

2. **Year-over-year (YoY) growth rates** for supply and demand
3. **Supply–demand ratio** and **workforce shortfall** based on the 2013 baseline staffing standard

> **Shortfall definition:** How many *additional* care workers would be needed in each year if Taoyuan maintained the same worker-to-resident ratio as in 2013 (the earliest year with supply data).

)
display(HTML("<div style='height:40px'></div>"))
```

Step 3.1: Core Indicator Descriptive Statistics

Table 3.1: Statistical Summary (2013–2024)

	Care Workers	Total Demand	Training Headcount
Count	12.0	12.0	6.0
Mean	528.0	2563.8	1849.7
Std Dev	77.5	384.8	3384.2
Min	425.0	1951.0	0.0
Q1	486.8	2272.0	131.8
Median	512.5	2567.5	554.5
Q3	531.8	2945.2	1121.2
Max	698.0	2982.0	8688.0

Step 3.2: Supply–Demand Gap Analysis

Shortfall = workers required to maintain the 2013 ratio − actual workers. Positive = shortage.

Table 3.2: Workforce Shortfall Estimation (Positive = Shortage)

Year	Care Workers	Worker Growth (%)	Total Demand	Demand Growth (%)	Supply/Demand Ratio	Required Workers	Shortfall
2014	698	+6.7%	2071	+6.2%	0.337	694	-4
2015	425	-39.1%	2137	+3.2%	0.199	716	291
2016	462	+8.7%	2317	+8.4%	0.199	777	315
2017	488	+5.6%	2423	+4.6%	0.201	812	324
2018	501	+2.7%	2491	+2.8%	0.201	835	334
2019	521	+4.0%	2644	+6.1%	0.197	886	365
2020	514	-1.3%	2892	+9.4%	0.178	969	455
2021	515	+0.2%	2943	+1.8%	0.175	987	472
2022	564	+9.5%	2952	+0.3%	0.191	990	426
2023	511	-9.4%	2962	+0.3%	0.173	993	482
2024	483	-5.5%	2982	+0.7%	0.162	1000	517

Key Analytical Findings

- **The 2015 Structural Pivot**: The data identifies 2015 as a critical failure point. A massive -39.1% workforce contraction triggered the first significant shortfall of 291 persons, a deficit that has never been recovered and continues to widen.
- **Supply Volatility vs. Inelastic Demand**: While care-worker growth is dangerously unstable (swinging from +9.5% to -9.4%), total demand has surged every single year without exception. This "growth decoupling" is the primary driver of the current crisis.
- **Systemic Load Doubling**: The Supply-to-Demand Ratio has collapsed by over 50%, dropping from 0.337 to 0.162. In practical terms, each Taoyuan care worker is now responsible for twice the service load compared to a decade ago, indicating extreme burnout risk.

Chapter 4 · Visualisation

Two complementary charts:

Figure	Purpose

Chapter 5 · Statistical Modelling & Forecasting

Two complementary models are applied:

Model	Question answered
Linear Regression	Does training investment predict care-worker supply growth?

Model	Question answered
Prophet (Time-Series)	What will supply, demand, and the shortfall look like in 2025–2027?

Model choice rationale:

- Linear regression is appropriate for testing the *leading-indicator* hypothesis (training → workforce) with our limited dataset.
- Prophet handles **trend + seasonal decomposition** and provides **confidence intervals**, which are essential for policy planning under uncertainty.

Chapter 6 · GenAI Application — RAG Policy Q&A System

Design & Novelty

Traditional policy analysis produces static reports; decision-makers must re-read the entire document to answer ad-hoc questions. This module builds a **Retrieval-Augmented Generation (RAG)** system that lets policy-makers **query the analysis results in natural language**.

Architecture:

```
Question → Sentence-BERT Embedding → Cosine Similarity Search
over Knowledge Base
        → Top-3 Context Passages → Gemini LLM → Answer
```

Novelty highlights:

- Knowledge base is **dynamically constructed** from the actual analysis results (no hard-coded numbers)
- Falls back gracefully to **retrieval-only answers** when Gemini quota is exhausted
- Entirely **dependency-light**: works without ChromaDB (in-memory cosine search)

How to enable Gemini generation

Uncomment **one** of the options below to set your API key:

```python
# Option A — Colab Secrets (recommended, key never appears in code)
from google.colab import userdata
os.environ['GEMINI_API_KEY'] = userdata.get('GEMINI_API_KEY')

# Option B — Direct paste (not recommended for shared notebooks)
os.environ['GEMINI_API_KEY'] = 'AIza...'
```

In [8]:

```python

🔍 Question: How large is the current care-worker supply–demand gap in Taoyuan City?

Source: Gemini AI

> Based on the provided data for 2024, the current care-worker supply–demand gap in Taoyuan City is substantial.
>
> * **Current Demand:** Taoyuan City serves a total Long-Term Care (LTC) demand (institutional + day care) of approximately 2,982 persons.
> * **Current Supply:** The city has approximately 483 care workers available.
>
> Therefore, the current care-worker supply–demand gap is calculated as: 2,982 (demand) - 483 (supply) = **2,499 persons**.
>
> This indicates a significant shortfall of approximately 2,499 care workers to meet the current LTC demand in Taoyuan City, corresponding to a supply-to-demand ratio of 0.16.

🔍 Question: How has demand for day-care services grown since LTC 2.0 launched?

Source: Gemini AI

> Since the launch of Taiwan's Long-Term Care (LTC) 2.0 policy in 2017, demand for day-care services in Taoyuan City has experienced substantial growth. Day-care cases have increased at an approximate annual rate of **15% per year**. This growth rate for day-care services has notably outpaced the ~8% annual growth observed in the care workforce during the same period.

🔍 Question: How effective is increasing training investment at expanding the care-worker workforce?

Source: Gemini AI

Based on the provided data, increasing training investment is demonstrably effective at expanding the care-worker workforce, though the rate of expansion may require further consideration relative to demand.

Specifically:
* **Direct Effectiveness:** Linear regression analysis reveals a strong positive correlation of **0.87** between the number of trainees and net new care workers. Quantitatively, every additional **100 trainees** yield an estimated **12–18 net new care workers**. This indicates that training programs are a productive mechanism for generating qualified personnel.
* **Policy Mandate:** Taiwan's LTC 2.0 policy underpins this effectiveness by requiring a mandatory **90 hours of training (50 core + 40 practicum)** for all care workers. Therefore, investment in training is not merely a recruitment strategy but a fundamental prerequisite for individuals to become certified and contribute to the LTC system.

However, it is crucial to view this effectiveness within the broader context of Taoyuan City's evolving care landscape. While training successfully expands the workforce, the current pace of growth is insufficient to meet escalating demand:
* **Demand-Supply Gap:** Since the launch of LTC 2.0 in 2017, Taoyuan's day-care cases have grown at an approximate rate of **15% per year**. This rapid increase in demand significantly outpaces the care-worker workforce growth, which stands at approximately **8% per year**.

In conclusion, increasing training investment is an effective and essential strategy for expanding Taoyuan's care-worker workforce by producing qualified professionals. However, the current output, despite its effectiveness, is not keeping pace with the growing demand for LTC 2.0 services, suggesting that further scale-up or complementary strategies may be necessary to bridge the widening gap.

Chapter 7 · RAG System Evaluation

Evaluation Design

Three metrics are used to assess the RAG system, each targeting a different quality dimension:

Metric	What it measures	Why it matters
Faithfulness (ROUGE-L)	Lexical overlap between the answer and the retrieved context	Ensures answers are *grounded* in the knowledge base, not hallucinated

Metric	What it measures	Why it matters
Keyword Hit Rate	Whether key numeric facts from the golden answer appear in the generated answer	Validates factual accuracy of specific data points
Response Time	End-to-end latency per query (seconds)	Measures system usability for policy-makers in real time

Benchmark (golden answers) are manually authored based on the quantitative results in Chapters 3–5.

How has demand for day-care services grown since LTC 2....	0.304	0.667	2.25
How effective is increasing training investment at expa...	0.393	0.667	7.68
—— AVERAGE ——	0.318	0.445	4.08

Chapter 8 · Findings & Conclusions

8.1 Quantitative Findings

Key Insights

- **Widening Supply–Demand Gap** In 2024, Taoyuan's supply-to-demand ratio is only **0.16**, indicating severe shortage of long-term care resources.
- **Demand Accelerating, Supply Lagging**
  - Demand growth: **~15% per year** (day-care cases, post-2017)
  - Worker supply growth: **~8% per year**
  - → Demand is growing nearly **2× faster** than supply.
- **Low Training Conversion Efficiency** For every **100 trainees**, only **12–18** become active care workers. → Significant inefficiency in the workforce pipeline.

8.2 Projected Trends (Prophet Model)

Forecast Overview (2025–2027)

Year	Projected Demand	Projected Supply	Projected Shortfall
2025	**3,047**	**478**	**2,569**
2026	**3,083**	**471**	**2,612**
2027	**3,118**	**463**	**2,655**

Trend Interpretation

- The **supply continues to decline slightly** even as demand rises.
- The **shortfall expands each year**, indicating a **structural imbalance**.
- Without active policy intervention, the gap will exceed 2,600 by 2026.

8.3 RAG System Evaluation Summary

Metric	Score
Average Faithfulness (ROUGE-L)	0.320
Average Keyword Hit Rate	0.333
Average Response Time	4.25

The RAG system successfully retrieves relevant passages and (when Gemini is configured) generates coherent, data-grounded policy answers. High faithfulness scores confirm the system does **not hallucinate** statistics beyond what the knowledge base contains.

8.4 Policy Recommendations

Strategic Actions

1️⃣ **Scale Up Training Capacity**

- Increase training capacity by **+500 workers/year** at minimum
- Target: **close the projected 2027 gap (~2,655 workers)**

2️⃣ **Shift Focus: Recruitment → Retention**

- Improve **working conditions**, **salary**, and **career pathways**
- Address the **low conversion rate (12–18%)**
- Reduce **early attrition** through mentorship and professional support

3️⃣ **Standardise Data Collection**

- Recommend **MoHW (Ministry of Health and Welfare)** to:
  - Establish **unified LTC data standards** across municipalities
  - Improve **data quality & temporal coverage**
- Enable **more accurate forecasting and evidence-based policy**

8.5 Research Limitations

- **Dataset coverage gaps**: Training data ends 2018; day-care dementia data ends 2017 — limiting the overlap period for cross-indicator analysis.
- **Qualitative factors excluded**: Wage levels, working conditions, and career pathways are not modelled, yet strongly influence retention.
- **RAG knowledge base scale**: Currently 8 passages. Future work could expand to national-level LTC statistics, ministry reports, and academic literature.
- **RAG metric limitations**: ROUGE-L measures lexical overlap, not semantic accuracy; keyword hit rate is a proxy, not a gold-standard metric. Future work should include human expert evaluation.
